

waterALERT

The monitoring water quality in Canada

All Quebec municipalities are responsible for collecting **samples of water for analysis**. **Lévesque Bohémier & Associés** was the first Canadian company to develop a **program for monitoring the quality of water** in the country.

Health Canada has been the first to use a licensed version of this program. They use it to check water quality **in all facilities under their jurisdiction**, including airports, aircraft, beaches and mobile equipment.

Main features of the **waterALERT** program

- ✓ All your work is done **through the Internet, in real time**. No supplementary equipment required.
- ✓ **Rental** of the server space only.
- ✓ **Security** guaranteed based on your user code and your confidential password.
- ✓ The program interface is identified **with your name and your colours**.
- ✓ Language of your choice: **French or English**.
- ✓ All data is kept on a **server external to your facilities**.
- ✓ When you enter bacteriological and physicochemical data, **alerts are sounded if your safety criteria are not met**. Alert options: "Stop consumption", "Boiling notice" or others, at your choice.
- ✓ **You determine** your own control points, data input schedule and qualitative criteria.
- ✓ Obviously, as a **traceability tool** for water quality surveillance, nothing can beat it. You maintain a completely automated register of data and record the proof that analyses were carried out. No more manual data entry that can get lost or filed in the wrong place.
- ✓ It's an **insurance policy against possible court actions**. You can prove that you have conducted your analyses and that the results are duly recorded.
- ✓ Maintenance service (server and program) from 9 to 5, Monday to Friday. But **the server accepts your data 24 hours a day, 7 days a week**.

New in 2006

New starting in 2006, **waterALERT** can compare historical data with collected results in real time, directly at points of control of your choice. The results are thus validated instantly.
